Concord, NH 03302-0095

**RE: Application of Granite Reliable Power, LLC for Certificate of Site and Facility  
for the Granite Reliable Windpark in Coos County  
Docket No. 2008-04**

Dear Chairman Burack:

Enclosed for filing with the NH Site Evaluation Committee is the NH Fish and Game Departments' pre-testimony regarding impacts to wildlife and their habitats for the proposed development of the Granite Reliable Power project in Coos County, NH.

The Fish and Game Department is the sole state agency that has been tasked with the protection and management of the state's wildlife. See RSA 206:10. Under RSA 162-H: 16, IV, the specially-designated Subcommittee of the Site Evaluation Committee must fully review the environmental impact of this proposal (Docket No. 2008-04), including its impact on wildlife, and must determine whether the proposal will have an "unreasonable adverse effect on the natural environment." Accordingly, the Fish and Game Department submits the testimony of biologists, Will Staats and Jillian Kelly, to assist the Subcommittee in its review of the proposal.

Further, the Site Evaluation Committee has an independent responsibility to comply with RSA 212-A: 9, III. The Fish and Game Department expects that the enclosed testimony will be vital in the Subcommittee's determination of the effect of this proposal on endangered and threatened species in the state, pursuant to RSA Chapter 212-A.

If you have any questions or comments, please do not hesitate to contact me at 271-3511. Thank you in advance for attending to this matter.

Sincerely,

Carol B. Henderson  
Environmental Review Coordinator

Cc: Steven J. Weber, Chief of Wildlife

8 RE: APPLICATION OF GRANITE RELIABLE POWER, LLC  
9 FOR CERTIFICATE OF SITE AND FACILITY  
10 FOR GRANITE RELIABLE POWER WINDPARK  
11 IN COOS COUNTY  
12

13  
14 TESTIMONY OF WILL STAATS AND JILLIAN KELLY ON BEHALF OF THE NEW  
15 HAMPSHIRE FISH AND GAME DEPARTMENT  
16

17 DECEMBER 2008  
18

19  
20 The Fish and Game Department has concerns regarding impacts on a number of  
21 species of wildlife that depend on or use the rare and unique high elevation forested  
22 habitat this project is located within.  
23

24 **Qualifications - Will Staats**

25 **Please state your name and business address.**

26 William Staats. New Hampshire Fish and Game Department 629B Main Street,  
27 Lancaster, New Hampshire 03584-3612.  
28

29 **Who is your current employer and what position do you hold?**

30 I am currently employed at the New Hampshire Fish and Game Department  
31 (NHFGD), 629B Main Street, Lancaster NH 03584, as a Regional Wildlife Biologist.

32 As the regional Wildlife Biologist I am responsible for a wide range of duties  
33 including; providing regional perspectives and data regarding wildlife and related issues

1 for statewide game and non-game programs. My responsibilities include providing  
2 technical assistance to landowners regarding wildlife habitat, including large timber  
3 investment management organizations and the US Forest Service. I work closely with  
4 partners including the US Fish and Wildlife Service and a variety of NGO's.

5

6 **What is your background and qualifications?**

7 I earned a Bachelor of Science degree in Wildlife Biology from the University of  
8 Vermont in 1980. I was hired by F&G in January of 1993. I am a certified wildlife  
9 biologist. During my career I have been employed as a forester and wildlife specialist  
10 for Champion International and provided wildlife recommendations on their 460,000-  
11 acre land base located in New Hampshire, Vermont and New York. I also worked as a  
12 biological technician for the Vermont Fish and Wildlife Department based out of a district  
13 office in northern Vermont.

14 I have extensive experience working on issues related to high elevation areas in  
15 New Hampshire and Vermont. This includes: performing environmental review in high  
16 elevations areas through the Act 250 development law in Vermont, providing technical  
17 assistance to forest landowners on high elevation areas in New Hampshire, chairing the  
18 high elevation subcommittee as part of the NH forestry roundtable, and participating in  
19 the formulation of the High Elevation MOU. I am also consulted by the Coos County  
20 Unincorporated Towns Planning Board to review timber harvests and development  
21 projects pertaining to designated wildlife areas and high elevation habitats. On a non-  
22 professional basis, I have spent countless days at these elevations over the last 30  
23 years hunting and trapping in this unique environment.

24

1 **Qualifications - Jillian Kelly**

2 **Please state your name and business address.**

3 Jillian Kelly. New Hampshire Fish and Game Department 629B Main Street,  
4 Lancaster, New Hampshire 03584-3612.

5

6 **Who is your current employer and what position do you hold?**

7 I am currently employed by the New Hampshire Fish and Game Department  
8 (NHFGD), 629B Main Street, Lancaster NH 03584, as an Assistant Regional Wildlife  
9 Biologist.

10 As the Assistant Regional Wildlife Biologist, I am responsible for a wide range of  
11 duties. I spend a little more than half of my time managing a 25,000-acre Wildlife  
12 Management Area in northern NH. Management of the property includes: general  
13 maintenance duties, maintaining public access, identifying and coordinating habitat  
14 management for wildlife, and monitoring the use of the property by wildlife. The  
15 remainder of my time is spent assisting the Regional Wildlife Biologist in Regional duties  
16 that include, providing technical assistance to landowners on wildlife and habitats; as  
17 well as, providing a regional perspective on both game and non- game programs.

18

19 **What is your background and qualifications?**

20 I earned a Bachelor of Science degree in Wildlife Management from the  
21 University of New Hampshire in 2000. I have worked full time for NHFG since 2000,  
22 excluding a 16-month leave of absence for my masters program. I earned a Masters of  
23 Science in Wildlife and Fisheries Conservation from the University of Massachusetts in  
24 September of 2005. The title of my thesis is *Recent Distribution and Population*

1 *Characteristics of American Marten in New Hampshire and Potential Factors Affecting*  
2 *Their Occurrence*, which can be found on the NH Fish and Game Department website at  
3 ([http://wildlife.state.nh.us/Wildlife/Wildlife\\_PDFs/Pine\\_marten\\_thesis\\_JKelly.pd](http://wildlife.state.nh.us/Wildlife/Wildlife_PDFs/Pine_marten_thesis_JKelly.pd)). I have spent the  
4 majority of my professional career working with marten. From this thesis there is  
5 currently one paper submitted for peer review and publication and another that is  
6 proposed to be submitted.

7 I am also a certified Wildlife Biologist and active member of The Wildlife Society.

8

9 **Purpose of Testimony:**

10 **Q. What is the purpose of your testimony?**

11 The purpose of this testimony is to present New Hampshire Fish and Game's  
12 assessment of the impacts of the proposed Granite Reliable Power Project (GRP  
13 Project) in Coos County, New Hampshire, on the wildlife of the region.

14 We are familiar with the GRP Project. We have reviewed the plans submitted by  
15 the applicant, as well as the testimony of Adam J. Gravel and Steven K. Pelletier, also  
16 submitted by the applicant. We have also reviewed the results of the Winter Tracking  
17 survey (Appendix. 25) submitted by the applicant.

18 Will Staats has visited the proposed site numerous times in a professional  
19 capacity; as well as, personal manner. During 2008 alone, he estimates that he has  
20 been to the project area seven times both during winter months; as well as, during snow  
21 free periods. Jillian Kelly has also visited the proposed site numerous times, primarily in  
22 a professional capacity. During 2008, she has been to the site four times both during  
23 winter months; as well as, during snow free periods. In preparing the testimony, we  
24 relied upon the Master's thesis of Jillian Kelly, dated September of 2005, which is

1 attached to the testimony as Exhibit 1. (Exhibit 1 is available online at  
2 ([http://wildlife.state.nh.us/Wildlife/Wildlife\\_PDFs/Pine\\_marten\\_thesis\\_JKelly.pd](http://wildlife.state.nh.us/Wildlife/Wildlife_PDFs/Pine_marten_thesis_JKelly.pd). A paper copy will be  
3 made available on request.) This same thesis is cited by the applicant's consultants in  
4 the 2007 Winter Track Survey that has been submitted to the Site Evaluation Committee  
5 and referenced in the applicant's testimony.

6

7 **Q. What is the State's responsibility in reviewing a project of this nature?**

8 The Fish and Game Department is the sole state agency that has been tasked  
9 with the protection and management of the state's wildlife. See RSA 206:10.

10 Additionally, the New Hampshire Fish and Game Department is authorized to review  
11 this project and offer comments pursuant to RSA 212-A: 9. RSA 212-A: 9 states that  
12 "All other state departments and agencies shall take such action as is reasonable and  
13 prudent to insure that actions authorized, funded, or carried out by them do not  
14 jeopardize the continued existence of such species or result in the destruction or  
15 modification of habitat of such species which is determined by the executive director to  
16 be critical."

17 Although critical habitat has not been defined or designated for any species in  
18 New Hampshire, the high elevation forested habitats within the project area have been  
19 identified as core American marten (state threatened species) habitat in NH (Exhibit 1  
20 (Kelly 2005)). Habitats found within the project area, specifically on Dixville Peak and  
21 Mt. Kelsey, are especially critical to marten due to their location on the landscape and  
22 the extensive amount of suitable habitat found at these locations. For these reasons,  
23 the habitats found in these areas would meet any definition or designation criteria that  
24 would be developed by the Department.

1 **Q. What is unique about high elevation habitat?**

2 High elevation lands have long been recognized by our Department as a critical  
3 component of the landscape and provide unique habitat features for a variety of wildlife,  
4 which include state and federally listed species. The forest cover on these lands is  
5 characterized by a high percentage of spruce and fir. New Hampshire Fish and Game's  
6 Wildlife Action Plan contains a section devoted exclusively to High Elevation Spruce-Fir  
7 Forest. This profile asserts that these forests offer some of the last blocks of large,  
8 remote contiguous blocks of spruce-fir habitat. In addition, this profile outlines the rarity  
9 of this habitat, accounting for only about 4% of the state's land area and this habitat type  
10 supports sixty-six vertebrate species. Under the proposed project, significant portions of  
11 high elevation habitat will be greatly impacted.

12 At elevations of 2700 feet and higher, spruce and fir forest dominate the species  
13 composition along the ridgelines and upper slopes of these higher mountains. The  
14 remaining forest type is composed of mixed wood stands in the transition zones. Both  
15 spruce-fir and mixed wood at these elevations can provide complex forest stand  
16 structure, including larger diameter cavity trees, snags and large woody debris for  
17 wildlife. Mountain ash is found interspersed among these stands, providing an  
18 important soft mast food source for many species of wildlife ranging from the American  
19 marten to black bear.

20 High elevation forests are subject to natural disturbances that result in a variety of  
21 tree size classes and stand distribution. Patches of blown down trees as a result of, "fir  
22 waves" and insect or wind events, create small openings and dense early successional  
23 spruce and fir. These areas provide ideal habitat for lynx or Bicknell's thrush, while

1 dead and dying trees create habitat conditions suitable for three-toed woodpeckers and  
2 provide den sites or feeding opportunities for marten.

3

4 **Q. What involvement have you and your Department had regarding the long-term**  
5 **management or protection of high elevation lands in New Hampshire?**

6

7 Due to the value and high sensitivity of these habitats, the NH Fish and Game

8 Department has initiated and/or participates in two levels of involvement in the

9 management of high elevation lands. The Coos County Unincorporated Towns

10 Planning Board has designated these areas as a Protected District (PD), which is

11 defined as an “*area where development would jeopardize significant natural,*

12 *recreational, and or historic resources*”. Areas above 2700 feet in this case are defined

13 as PD6 zones, which include steep slopes and high elevations. The specific purpose of

14 the PD6 zone is to: “*regulate certain land use activities in mountain areas in order to*

15 *preserve the natural equilibrium of vegetation, geology, slope, soil and climate in order*

16 *to reduce danger to public health and safety posed by unstable mountain areas, to*

17 *protect water quality, and to preserve mountain areas for their scenic values and*

18 *recreational opportunities.*” Due to their designation as a PD6 zone, any activities at

19 these elevations must acquire a permit from the Coos County Planning Board.

20 Historically, the Board has relied on NH Fish and Game to review and comment on

21 these permit applications.

22 The second level of involvement involves a High Elevation Memorandum of

23 Understanding (MOU), initiated by NH Fish and Game and others, which set out to

24 protect the values of high elevation habitats. In a collaborative effort involving nearly all

25 of the large landowners in northern NH, the MOU allows logging but provides guidelines

1 and specific goals for forest size class distribution above 2700 ft. This document also  
2 makes recommendations on road building and the timing of harvesting activities.

3 Will Staats was chair of the scientific sub-committee on developing best  
4 management practices for high elevation areas, deer yards, riparian areas and other  
5 wildlife habitats for the Forestry Laws Recodification Roundtable. It was the consensus  
6 of this group that no timber harvest was the most effective strategy to safeguard the  
7 natural resource attributes at these elevations. Recognizing that landowners had a  
8 desire to harvest some timber from these areas, this subcommittee initiated the high  
9 elevation MOU, which represents a compromise to achieve some protection of this  
10 habitat.

11

12 **Q. What kinds of human activity occur currently at these elevations?**

13 Due to the inaccessibility of these high elevation forests in New Hampshire, many  
14 of the mountains north of the White Mountains see little disturbance by human activity.  
15 This area is unlike the remainder of northern New Hampshire, where there is a multitude  
16 of logging roads found at lower elevations, providing humans access to much of the  
17 landscape. In fact most of the high elevation summits in Northern New Hampshire have  
18 no organized high elevation hiking trails. Human activity is limited to occasional hunters  
19 and peak baggers. Recognizing that there already exists many miles of hiking trails in  
20 the White Mountain National Forest, concerns about concentrated human activity in  
21 these sensitive areas have prompted our Department to recommend organized hiking  
22 trails be moved out of high elevation forests, if possible. As an example, during the  
23 development of the Coos Trail we worked with trail designers to keep the trail off  
24 ridgelines above 2700 feet to the extent possible. Logging operations at these areas

1 represent the majority of disturbance and these occur very infrequently, perhaps every  
2 80 to a hundred years, due to the slow growth of trees on these sites.

3

4 **Q. How would you characterize the human activity on the ridgelines slated for this**  
5 **project?**

6

7 Like most of the high elevation ridgelines in Coos County, there is very little  
8 activity on the ridges that have been targeted for turbine erection. In all likelihood, fewer  
9 than a dozen people visit the summits of some of these ridges over the year and some  
10 summits are not visited by people in consecutive years. We base this assessment in  
11 part by entries recorded into journals located in containers placed at the top of  
12 mountains 3000 feet and higher by AMC and other peak baggers. Dixville Peak would  
13 be the exception due to the trail leading to its summit. This gets frequent snowmobile  
14 traffic during the winter months.

15 We strongly disagree with the statement “wildlife at the site have adapted to an  
16 environment with frequent disturbances and changing conditions and are accustomed to  
17 management activities and vehicle traffic?” (Page 27 of the Gravel testimony)

18 While the above statement may be true for some species and habitats at lower  
19 elevations on the GMO and Bayroot properties, this is not the case within the high  
20 elevation habitats bisected by the proposed project. On both properties these areas  
21 remain the last remote, largely undisturbed areas where management activities and  
22 vehicle traffic are essentially non-existent.

23 If this development moves forward as proposed, there will be human activity far  
24 more frequent than these areas have ever experienced before. We also believe it will  
25 be exceedingly difficult, if not impossible, to limit human access to these ridgelines once

1 developed with an extensive road system. This increased human activity has the  
2 potential to alter wildlife movements, breeding and feeding behaviors and may create a  
3 zone of avoidance extending out some distance from the project footprint.

4

5 **Q. How do these high elevation areas relate to the landscape as a whole on the Phillips**  
6 **Brook area?**

7

8 In the project area, Kelsey and Dixville peaks comprise the two larger patches of  
9 high elevation forest (1667 acres on Mt. Kelsey and 1873 acres on Dixville Peak). Of  
10 these, Mt. Kelsey is the least disturbed in recent history. According to the 2001 Granit  
11 Land cover layer, approximately 846 acres of Mt. Kelsey is classified as the spruce and  
12 fir forest type, with the remaining acreage above 2700 feet classified as mixed wood,  
13 while over 900 high elevation acres are classified as spruce and fir on Dixville Peak.  
14 Tree ring counts of tree growth on newly cut fir stumps at the meteorological (met) tower  
15 location on Mt. Kelsey, indicated that these trees were between 80 and one hundred  
16 years of age. Existing forest stands on Kelsey include a variety of size classes,  
17 including larger diameter red spruce, balsam fir; as well as, dense thickets of sapling  
18 and pole sized spruce and fir. Ledge outcrops and boulders on this mountain are  
19 additional features beneficial to wildlife.

20 On the Phillips Brook GMO property, lower elevation forests have been harvested  
21 aggressively. The ice storm of 1998 prompted heavy harvesting to salvage damaged  
22 trees in a number of these harvest areas. Thus, the high elevation forests represent  
23 some of the last intact older aged forest stands in the area. Mt. Kelsey as an example is  
24 a large block of forest that has not seen any recent harvest above 2700 feet in elevation.  
25 The same could be said for Dixville Peak, as well.

1  
2 **Q. Does the current landowner have a permit to harvest timber above 2700 feet on Mt.**  
3 **Kelsey?**

4  
5           It is true that there is a current permit to harvest timber on this mountain that we  
6 have reviewed and approved in a letter to the Coos County Planning Board. We looked  
7 at this area twice with the forester during 2008, in an effort to design a cutting plan that  
8 would work to protect habitat on the mountain. The cutting prescription outlined for this  
9 permit details a set of conditions, including no timber harvest above 3000 feet.

10

11 **Q. What significance do the high elevation areas on the GMO property have to the**  
12 **greater Northern New Hampshire landscape?**

13  
14           In the context of the northern New Hampshire landscape, Mt. Kelsey, and Dixville  
15 Peak both represent large areas of high elevation land and significant habitat patches of  
16 spruce and fir. As a comparison, two high elevation areas including the summits of Rice  
17 and Cave Mountains to the north of the project area, have only 350 acres classified as  
18 the spruce and fir forest type combined.

19           The impacts of recent timber harvest on high elevation lands is clearly  
20 demonstrated in the recent publication entitled "North Country Timber Harvest Trends  
21 Survey" produced by the Society for the Protection of New Hampshire Forests. This  
22 Landsat analysis of timber harvest in 41 north country municipalities revealed the  
23 following:" One unexpected finding of this project is that considerable timber harvest has  
24 been occurring above 2700 "during all three periods."... And continues, "Generally,  
25 about 6100 acres or 27% of private land above 2700' has been harvested since 1988. "  
26 The report adds," satellite data show significant areas have been predominantly cleared  
27 since 1992." Despite protective efforts in the last decade as a result of the high

1 elevation MOU, timber harvests in some instances have reduced spruce and fir forests  
2 on ridgelines to narrow corridors of older aged, relatively undisturbed high elevation  
3 forests. Recent heavy timber harvest on Mt. Kelsey for example, extends to the 2700-  
4 foot elevation with harvests slated above 2700 feet in the near future. Given the slow  
5 recovery of forest stands at these high elevations, it may be decades before many of  
6 these acres provide viable habitat for wildlife species of concern. Thus, the remaining  
7 lightly disturbed patches on the project area represents some of the best remaining  
8 habitat capable of supporting viable populations of marten, three toed wood pecker and  
9 Bicknell's thrush.

10 Will Staats has personally supervised timber harvests at high elevations as an  
11 industrial forester. It is his assertion that these harvests can result in damage to the  
12 terrain in these fragile areas that is long lasting. Road building and excavated skid trails  
13 are extremely intrusive, necessitating considerable earth moving and steep road cuts.  
14 Erosion to the thin soils can be extreme. He has witnessed the length of time trees have  
15 taken to recolonize a site after heavy timber harvest and feels it can be much longer  
16 than at lower elevations.

17

18 **Q. Could you describe for us in general terms the impacts of this proposal on wildlife?**

19 Impacts by this project can be characterized as impacts on habitat and impacts to  
20 individual animals or their populations. As described in the GRP High Elevation  
21 Mitigation plan, total impact to lands above 2700 feet, as described by the applicant is  
22 estimated at 58 acres. NH Fish and Game acknowledges that while only 58 acres of  
23 habitat will be directly affected through clearing or road building above 2700 feet, the  
24 impact of this project is far greater. The project bisects the remaining parcels of high

1 elevation habitat, and as a result, severely compromises the integrity and value of all the  
2 high elevation management areas in the project. Therefore, New Hampshire Fish and  
3 Game asserts that the full impact of this project extends to all the high elevation lands  
4 (3747 acres, as recorded by the applicant) found on the four high elevation ridgelines  
5 slated for development.

6         Impacts to individual wildlife and the potential to influence population viability are  
7 more difficult to quantify with this project because no similar project of this magnitude  
8 has ever occurred in New Hampshire, or anywhere in New England at such high  
9 elevations. Accordingly, literature on the direct and indirect impacts of these turbine  
10 strings and associated infrastructure is scarce.

11         While the proposed wind energy project has the potential to impact numerous  
12 wildlife species and their habitats, we will focus specific concerns for species that were  
13 identified in New Hampshire's Wildlife Action Plan, as "species in greatest need of  
14 conservation" or species that are typically of concern when reviewing a large-scale wind  
15 energy development. Two of these species, the American marten and the American  
16 three-toed woodpecker, are state-listed threatened species, and one, the Canada lynx,  
17 is a federally listed threatened species.

18

19 **Q. Could you describe the impacts of this project to the American marten?**

20         High elevation habitats are extremely important to marten in the project area due  
21 to increased snow depths, unique soil composition, inclement weather and infrequent  
22 logging. Each of these factors has dramatically impacted tree species composition and  
23 more importantly microhabitat features such as coarse woody debris and prey  
24 availability (Exhibit 1 (Kelly 2005)). American marten in the northeast can be found in

1 forests dominated by mixed coniferous; as well as, deciduous stands as long as they  
2 contain complex horizontal and vertical structure. In New Hampshire, this type of  
3 habitat is most common and most extensive at elevations above 2700 feet.

4 High elevation habitats found in the project area are considered part of core  
5 marten habitat in New Hampshire (Exhibit 1 (Kelly 2005)). Marten occurrence in this  
6 area has likely significantly contributed to marten re-colonization in New Hampshire and  
7 continues to serve as important core marten habitat. Occurrence records for marten are  
8 most numerous just north of the proposed project area. Yet marten occurrence has  
9 been documented in the project area as early as the 1980's (Exhibit 1 (Kelly 2005)).

10 Marten are exceptionally sensitive to low levels of fragmentation. Fragmentation  
11 results in increased isolation and decreases habitat suitability and stability. Marten have  
12 been documented in lower densities, in areas bisected by roads and associated with  
13 human activity.

14 Finally, while not well documented, it is very likely that the noise associated with  
15 the turbines will impact the use of a much larger area by marten. Therefore, forest  
16 fragmentation, habitat loss and disturbance could contribute to an exponential decline of  
17 marten in the project area.

18 Forest fragmentation and habitat use by marten has been extensively studied.  
19 Many of the statements above are supported by that research, as well as by Kelly 2005.

20

21 **Q. Are there some areas in the project area slated for development that has greater**  
22 **significance to marten than others?**

23

24 Dixville Peak and the habitats above 2700' around this peak are important core  
25 habitat; as well as, providing an important linkage to facilitate marten movement across

1 the landscape in New Hampshire. Based on the probability of marten occurrence maps  
2 (Exhibit 1 (Kelly 2005)), this mountain complex is the natural connecting feature  
3 between high elevation habitats to the north and the ridgeline to the south. The primary  
4 corridor for marten would extend off of Dixville along the Nash Stream/GMO boundary  
5 south. Dixville Peak is also the largest contiguous block in the proposed project area.  
6 The total area above 2700 feet is 1843 acres. Marten presence was documented on  
7 Dixville Peak as early as the 1980s. In general the habitat on Dixville Peak is composed  
8 of smaller diameter spruce/fir than that found on Mt. Kelsey. It would appear that  
9 compared to Kelsey, the habitat on Dixville has less complex horizontal and vertical  
10 diversity, yet it still has all the attributes needed to be considered good marten habitat.

11 Mount Kelsey is the second largest contiguous block of high elevation habitat in  
12 the project area with 1463 acres on Kelsey, directly adjacent to another 184 acres  
13 located on Owlhead Mountain. There appears to be extensive forest stands that have  
14 the complexity, which is ideal for marten on Kelsey. With the exception of tree cutting  
15 for the placement of the two met towers, no recent timber harvest has occurred on the  
16 mountain above 2700 feet. On site visits, marten sign was extensive (i.e. scat and  
17 tracks). As a result, the Department considers Mount Kelsey the best marten habitat  
18 within the project area.

19

20 **Q. What are your concerns regarding Canada lynx in the area?**

21 In the Northeast, important lynx habitat is highly associated with increased snow  
22 depths and prey availability. High elevation habitats have been identified as some of the  
23 most important areas for lynx in the state. As a result, NH Fish and Game is concerned  
24 that any net loss of habitat and fragmenting features, will limit future lynx distribution.

1 Lynx are potentially pioneering back into the state with confirmed reports of lynx tracks  
2 in northern New Hampshire; as well as, northern Vermont in recent years. During the  
3 winter of 2008, NH Fish and Game received anecdotal reports of lynx tracks observed in  
4 the Phillips Brook drainage. No lynx tracks were detected on the track surveys  
5 performed by the applicant. As a result, we would recommend that the applicant  
6 conduct directed searches for this species.

7         Our field reconnaissance reveals that snowshoe hare, a major prey species of  
8 lynx, are found commonly in the spruce and fir forests of the higher elevations. We  
9 found this to be true on visits to Mt. Kelsey in the winter of 2008. Human activity,  
10 infrastructure on the ridgeline and the operation of turbines could dissuade lynx from  
11 frequenting this previously relatively undisturbed habitat. The presence of this  
12 infrastructure on the ridgeline may prevent lynx from occupying this habitat and serve as  
13 a deterrent to movement through this landscape to other similar habitats.

14

15 **Q. Do you have concerns regarding the effect this development may have on Bicknell's**  
16 **thrush found on the project area?**

17

18         Bicknell's thrush can only be found breeding in the balsam fir-dominated forests  
19 on high elevation mountain slopes of the northeastern United States and lower elevation  
20 forests, further north in the Canadian Maritime Provinces. As a result, their habitat is  
21 very patchy and isolated, making the species very vulnerable to habitat loss and  
22 fragmentation. In addition, 45% of the potential habitat for this species **in the world** is  
23 found in New Hampshire. Therefore, NH Fish and Game has a global responsibility for  
24 this species, and we share New Hampshire Audubon's concern for Bicknell's thrush and  
25 agree with their report done for the Applicant, which states: *"the restricted breeding*

1 *range and limited extent of its specialized habitat makes the Bicknell's thrush one of the*  
2 *most vulnerable bird species breeding on the project area,"* The report continues stating:  
3 *"reduction and fragmentation of the limited habitat may have long term negative impacts*  
4 *on local and regional populations of this species."* According to recent data from the  
5 *North American Breeding Bird Survey Bicknell's have already disappeared from Dixville*  
6 *Notch to the north of the project area. One recent report has suggested that should this*  
7 *decline continue this species could be endangered within a few decades.*

8 We believe this project will result in a net loss of Bicknell's habitat in this project  
9 area. By the applicants' own admission, 58 acres above 2700 feet will be removed as a  
10 result of construction and road building. It is our opinion that the fragmenting effect of  
11 this road at these elevations will pose a risk to this bird species. Given that this  
12 development is unprecedented at these elevations, we can only speculate at what the  
13 disturbance of human activity, turbine operation and noise might be to the ability of the  
14 Bicknell's thrush to live on these ridgelines. These birds are currently living in this  
15 habitat because the conditions are suitable for its life requirements. It is our opinion that  
16 to introduce this level of development into this ecosystem is not compatible with the  
17 long- term health and viability of this species. Given the extremely limited global  
18 distribution of this species, we cannot afford to take any chances with this extremely  
19 rare bird species.

20

21 **Q. Do you have concerns about the effects of this project on the American three-toed**  
22 **woodpecker?**

23

24 In New Hampshire, the American three-toed woodpecker is listed as threatened,

25 and as a result, is profiled in the Wildlife Action Plan. Three-toed woodpeckers are

1 primarily found within high elevation habitats in New Hampshire, due to the higher  
2 abundance of dead and dying trees utilized by this species. Data from the North  
3 American Breeding Bird Survey (BBS) suggests a significant annual decrease in the  
4 population. In New Hampshire, according to the Atlas of Breeding Birds, there was a  
5 possible occurrence of a three-toed woodpecker in the Phillips Brook drainage in  
6 Millsfield. Audubon's breeding bird surveys conducted for the applicant indicated  
7 potential detections in 4 locations on Mt. Kelsey. Extensive logging is cited in the  
8 Wildlife Action Plan as contributing to the loss of habitat for this species. Again, any net  
9 loss of high elevation habitat has the potential to significantly impact this species in NH.  
10 The NH Fish and Game Department, therefore concurs with Audubon's report to the  
11 applicant that classifies American three-toed woodpecker as: "***one of the most***  
12 ***vulnerable bird species on the project area***", especially due to their use of habitat  
13 structure associated with high elevation areas.

14

15 **Q. What is your opinion of the mitigation package proposed by the applicant?**

16 The proposed buffer zone surrounding the roads and project footprint is not in our  
17 opinion, appropriate or adequate mitigation. As has been stated, the impacts of the  
18 project extend to the entire zone above 2700 feet, well beyond the project footprint.  
19 Therefore, the 500' buffer on each side of the fragmenting features is likely the area that  
20 will sustain the greatest impact from the project and therefore, has the lowest value of all  
21 high elevation lands in the area for mitigation.

22

23 **Q. In your opinion will this Project have an unreasonable adverse effect on the natural**  
24 **environment, more particularly threatened and rare species and other wildlife**  
25 **communities?**

1 Yes. For the reasons put forth in this testimony, we believe the project will have  
2 an unreasonable adverse effect on the natural environment, in particular the high  
3 elevation forest ecosystem and the wildlife that rely on it. We believe that this project  
4 will fragment limited and sensitive high elevation habitat, which is a rare component of  
5 New Hampshire's forested ecosystem and is critical habitat for American marten,  
6 Canada lynx, Bicknell's thrush and the American three-toed woodpecker. We feel that  
7 in their current condition, Mt. Kelsey and Dixville Peak are blocks of relatively  
8 undisturbed habitat, which are important both locally and regionally. This project has  
9 the potential to reduce the carrying capacity of these habitats for these species by  
10 eliminating habitat and negatively influencing wildlife behavior and their use of these  
11 areas. We do not agree with the testimony of Adam Gravel and Steven Pelletier where  
12 they state, **"Consequently no adverse effects resulting from the Project to the local  
13 marten population is anticipated."** We believe this project has the potential to render  
14 unsuitable much, if not all, of the best marten habitat on the project area, or reduce the  
15 value of this habitat for these state-listed animals. The project will displace these  
16 animals and adversely influence the ability of these high elevation ridgelines to serve as  
17 corridors for marten and Canada lynx expansion. We feel that the impacts of this project  
18 will be long lasting and far more intrusive than an occasional logging operation, which  
19 might occur on a limited portion of these high elevation areas. In addition, it is our  
20 opinion that the long-term viability of the Bicknell's thrush population is tenuous enough  
21 that it cannot afford any further permanent habitat loss or encroachment. Our  
22 Department has a long history of protecting high elevation habitat and remains  
23 convinced that it is in the best long-term interest of the wildlife resource and the public to

- 1 vigorously protect these areas. As proposed, the project will have a severe and
- 2 unmitigated adverse effect on the natural environment.
