Subject: Fwd: Disenchantment in Denmark

Dear Chairman Ignatius,

Following up on my recent note to you, here is yet another example, of a place that is "ahead" of us in wind turbine installations and is now regretting the economic, environmental and social impact of these turbines.

Denmark, France and Germany have all recently discovered that the positive economic, environmental and public impact assumptions they made about industrial wind energy have been flat out wrong. Rather, the impact of industrial wind has been deleterious as it so clearly has been here in the U.S. in states like California that are "leading" the other states in the installation of industrial wind clusters.

We don't need this unreliable, intermittent and often curtailed energy. PSNH says, as you know, there are far better renewable alternatives than wind turbines.

<http://www.telegraph.co.uk/news/worldnews/europe/denmark/7996606/An-ill-wind-blows-for-Denmarks-green-energy-revolution.htm>

Please help lead our state toward the energy future the EESE Board recommended. It's very apparent that those EESE RPS priorities cannot be achieved with wind turbines. The world is waking up to the truth. There are far better ways to achieve our renewable goals without relying on the false promises of industrial wind.

Thank you again for the great work the EESE did. Please help ensure it is translated into legislative and regulatory policy as well.

Sincerely,

Larry Goodman
