I am planning on attending the 5pm session at PSU Ice Arena in Holderness NH today and I would like to submit a question to the applicants before the SEC on the details of the future transition station in Bethlehem that will allow the overhead lines to go underground near The Rocks Estate. How large will the station be? How tall will the buildings be? What steps will be taken to minimize the visual impact of a "substation-type" facility to the nearby properties? Will "dark-sky" lighting and landscaping be considered, for example? What are the anticipated environmental impacts of building and maintaining the new station?
