Subject: Northern Pass; NH Site Evaluation Committee

To Whom it may concern;

The project has not completed the required studies to proceed. They have not done a single study as to the costs and efficacy of installing the power lines under ground. This point will be made in court should the project be approved in its current form.

This energy is for Southern New England. The proposal states that the energy users will be charged for the cost of delivery. If Southern New England wants to run their access lines through our state they can just as well pay to bury the lines. There is absolutely no reason to desecrate the beauty of NH to deliver energy that costs a little less to Southern New England.

Furthermore, Connecticut has a law in effect that requires all new high power lines to be buried. They have such a law for several reasons all of which are also applicable in this case. If overhead power lines are unacceptable for Connecticut why would it be acceptable to impose that result on another state's citizens? The answer is that it is not acceptable.

If Southern New England wants more power and also wants to the access lines to transit our state at least they could pay for the burial of said power lines.
