Hello,

When does a green source of power become not so Green? If one were to take a look at this project one answer would become apparent. If you were to drive around Wash DC area you might think they need more roadways. I might say they don't need more roads they need less cars.

The N.Pass project is intending on putting more power lines in a new Crack through my beloved wilderness.

I have a Crack running straight through my town brining power to those who need it. My question is why do we need another Crack. Why not use the existing by either upgrading or expanding?

The Current Administration seems intent on using public conservation lands as a right of way for whatever industry bids highest. I am not against the project, I am very much against the mis-use of conservation lands.

I sat at summit one day when a fellow outdoorsman planted a flag for a photo. I thought about the possibility of ISIS planting a flag on my mountain and how I swore to defend this land against all enemies, forgiven and domestic and what my reaction might be if that were to happen in my presence? Now you tell me, what is the difference?

Respectfully,

A.Lance Emrick
