This is a plan that was formed and begun largely without the public's knowledge. This is a plan that would incorporate older technologies when all this taxpayer money could be used to research and develop newer, cleaner technologies that have less impact on our environment from the production stage all the way through the distribution stage, producing less or none of the waste and or bi-product of the energy source itself. I'm speaking of graphene nanotech or thorium based cold fusion technology. These are just two of the very promising technologies that are possible to develop even further if only they could get funding. In my humble opinion, Northern Pass Project has no reasonable excuse for pushing this plan other than to line the pockets of the involved corporations with more money from taxpayer's pockets and take away citizen's property rights for those mega-corporations own benefit. Besides that, the United States certainly has NO NEED to depend on foreign sources of frankly, antiquated energy technology. The year is not 1980 something. The year is 2017 and America has all the means to produce our own energy systems. Thank you for lending your ears (so to speak)
