To Whom it may concern;

The height of the towers is a major concern.

If the number of poles was increased then they could shorter as the span between the plea would be less. The rational for the taller poles is in part to decrease the number of poles needed and increasing the length of the spans between the poles - however this means the pole has to be taller.

My rec is to bury the line or simply increase the number of poles and have shorter spans of wire between the poles.

Thank you.
