I am opposed to the Northern pass coming through NH.

This country is transitioning to renewable power and at the same time, working toward more energy efficient use of the power we do generate. Both of these movements are actively negating the need of these power lines. By the time they are built and operational, how long will they be used? And when the times comes that they need to be removed, who will pay that bill? NH taxpayers.

At the same time, money spent toward creating this power line will be money removed from research and development for more efficient sources and delivery systems for our future energy needs. What could be more backward, foolish and wasteful!

Last, but certainly not least, our future economy and tax base, (which is derived from land values) will be sullied by the ugly horrible scar of transmission lines overhead. How many photographers will want to visit our powerline divided state with their friends and families? How many movies companies will want to film here? How many writers, artists, campers, hikers and nature lovers will be inspired to call this state home or sustain our economy by paying money to vacation here? Do YOU want to live under high voltage lines?

No. The timing for Northern Pass has long passed. Put up Windmills? - maybe. Solar panels?, I could live with that. But a high voltage powerline carved through Concord - over my dead body if I have a say.
