Unlike northern pass, the granite state power link would use 100% EXISTING transmission line corridors to provide Canadian wind power to New England. The switching and converter stations planned with this project would also provide tap in points for future wind turbines in NH which would help lead our state into renewable and energy independence.

This project will create 2000 REAL jobs in NH and Vermont, and would deliver 100% clean, renewable, NON-IMPACTFUL energy. Unlike Northern pass this project WOULD NOT carve up undeveloped National Forest land, would not disrupt the beauty of rural towns and would be a huge step in the right direction for renewable independence in our state and New England.

Please, listen to the constituents and consider the facts, science, benefits over the pay outs you've received!
